

The Lab Environment

This Venafi Trust Protection Platform lab environment contains the following virtual machines that have been pre-configured with the proper networking and settings. The environment includes:

- **1x Trust Protection Platform Server (TPP 20.2)**
 - Microsoft Certification Authority (venafidemo-TPP-CA)
 - Active Directory Domain Services (venafidemo.com)
 - DNS (venafidemo.com)
 - IIS Server (for Venafi GUIs)
 - MS SQL Express 2016
- **1x Ubuntu Server (Apache)**
 - Minimal Install
 - Apache Web Server
- **1x F5 BIG-IP Server (BIG-IP)**
- **1x F5 BIG-IQ Server (BIG-IQ)**

VM	Internal IP	Internal DNS	CLI Username	CLI Password	GUI Username	GUI Password
BIG-IQ	192.168.1.200	bigiq.venafidemo.com	root	VenP@ss123!	admin	VenP@ss123!
BIG-IP	192.168.1.201	bigip1.venafidemo.com	root	VenP@ss	admin	VenP@ss
TPP Server	192.168.1.100	tpp.venafidemo.com	N/A	N/A	VENAFIDEMO\venafi_svc	5&Njgx8IGyHQ
Venafi Platform	192.168.1.100	tpp.venafidemo.com	N/A	N/A	tppadmin	Passw0rd123!

About This Lab

- [Section 1](#) - Automating Machine Identities with BIG-IP
- [Section 2](#) - Transitioning from BIG-IP to BIG-IQ
- [Section 3](#) - Deploying a new application using BIG-IQ & Venafi

Lab Steps

Section 0 - Verify & Refresh the Lab Environment

The BIG-IQ virtual machine sometimes has issues when resuming from a suspended state. The following steps will ensure all devices and services are working as expected, verify all settings are correct and demonstrate the current configuration of the environment.

1. Click **View VM** on *BIG-IQ*.
2. Click inside the black window and press **Enter** on the keyboard to wake up the CLI.
3. Restart BIG-IQ by typing the following command and waiting for services to come back (about 5 minutes). If you are required to login, please use the following credentials:

```
login: root
password: VenP@ss123!
-----
reboot now
```

- Click View VM on "Venafi TPP Server" and log into Windows using the following credentials, if prompted:

```
UN: VENAFIDEMO/Administrator
PW: Password123!
```

- Next, validate the current BIG-IP configuration by opening the "BIG-IP #1" bookmark and logging in with the following credentials:

```
UN: admin
PW: VenP@ss
```

NOTE: The management certificate for BIG-IP is also being managed by TPP. The management certificate for BIG-IQ will be self-signed.

Section 1: Automating Machine Identities with BIG-IP

An Apache web server has already been configured in the environment and is hosting a static, example application. This section will walk through the configuration of an F5 BIG-IP device providing SSL termination to that application while using a machine identity from Venafi Trust Protection Platform.

Configure BIG-IP

- Login to the Trust Protection Platform server, open a browser and navigate to <http://ubuntu-web> to verify the application is up and running. The Venafi Ecosystem background should be visible.
- Next, navigate to <https://bigip1.venafidemo.com> from within the TPP VM to start the configuration of BIG-IP. Login with the following credentials:

```
UN: admin
PW: VenP@ss
```

- Click on **Local Traffic > Nodes** and then the **Create** button to create a new Node.

4. Fill in the node information as follows:

```
"Name": "ecosystemapp"  
"Address": 192.168.2.101
```

Local Traffic » Nodes : Node List » New Node...

General Properties

Name	ecosystemapp
Description	
Address	<input checked="" type="radio"/> Address <input type="radio"/> FQDN 192.168.2.101

Configuration

Health Monitors	Node Default
Ratio	1
Connection Limit	0
Connection Rate Limit	0

Cancel Repeat Finished

- Navigate to **Local Traffic > Pools** and click the **Create** button to create a new Pool
- Use the following values to create the new pool:

```
"Name": "ecosystemapp_pool"
"Service Port": 80
```

NOTE: Make sure to click the **Add** button after specifying the port:

Configuration: Basic

Name: ecosystemapp_pool

Description:

Health Monitors:

Active:

Available:

Resources:

Load Balancing Method: Round Robin

Priority Group Activation: Disabled

New Members:

Address: ecosystemapp (192.168.2.101)

Service Port: 80 HTTP

Add

Node Name	Address/FQDN	Service Port	Auto Populate	Priority
ecosystemapp	192.168.2.101	80		0

Edit Delete

Cancel Repeat Finished

- Click **Finished** to create the new pool
- Navigate to **Local Traffic > Virtual Servers** and click the **Create** button to create a new Virtual Server
- Use the following values to create the virtual server:

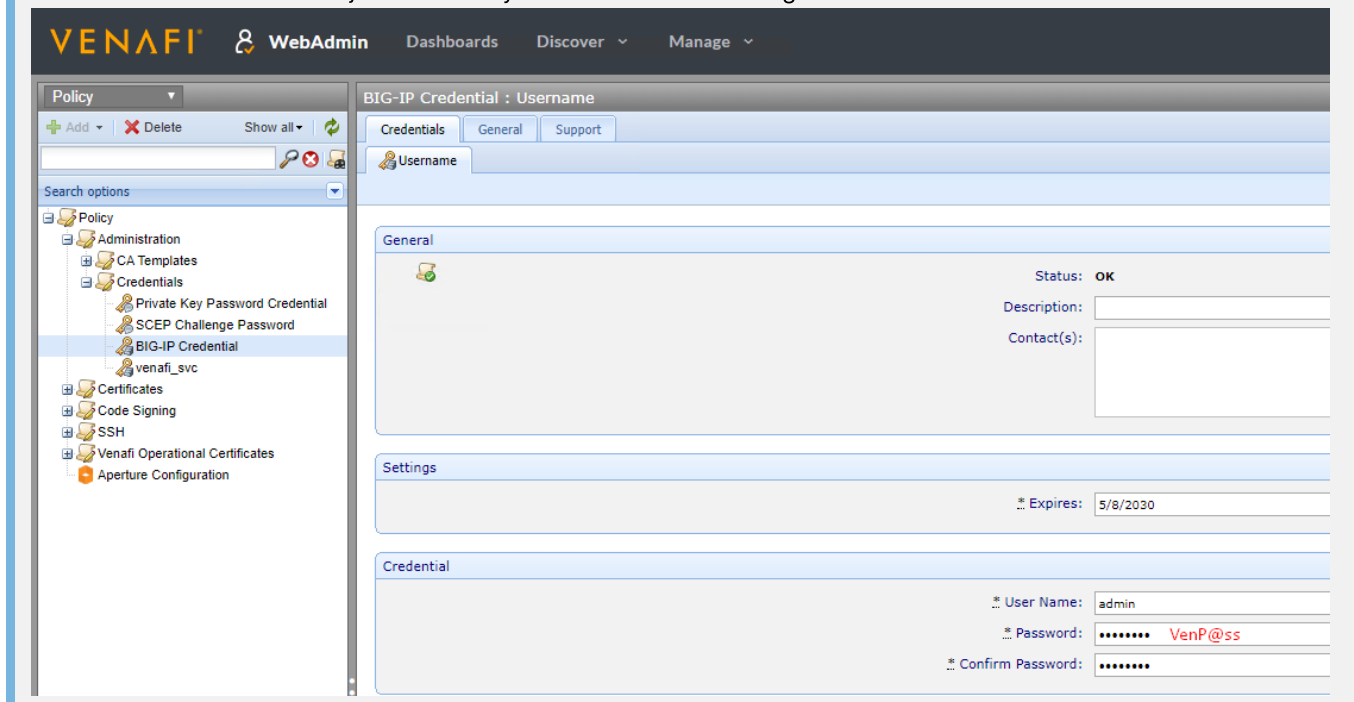

```
"Name": "vs_ecosystem"
"Source Address": 0.0.0.0/0
"Destination Address": 192.168.2.10
"Service Port": "https"
"SSL Profile (Client)": "clientssl"
"Source Address Translation": "Auto Map"
"Default Pool": "ecosystemapp_pool"
```

General Properties	
Name	vs_ecosystem
Partition / Path	Common
Description	
Type	Standard ▼
Source Address	<input checked="" type="radio"/> Host <input type="radio"/> Address List <input type="text" value="0.0.0.0/0"/>

10. At this point, BIG-IP is hosting the ecosystemapp application at the virtual IP <https://192.168.2.10>, but the application is not using a valid certificate yet.

Configure Venafi

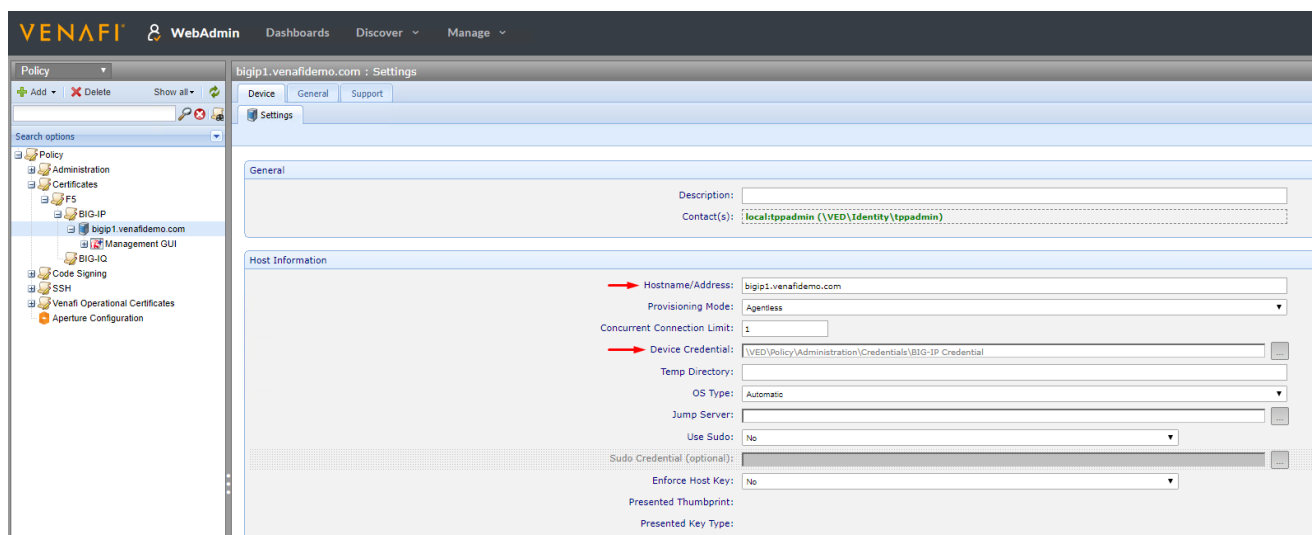

NOTE: A BIG-IP Credential Object has already been created in TPP using the BIG-IP credentials from earlier in the lab:

1. Log into Web Admin using the **Venafi TPP** bookmark in the Chrome bookmark toolbar:

2. Navigate to **Policy > Certificates > F5 > BIG-IP > bigip1.venafidemo.com**. A BIG-IP Device Object has already been created in TPP using the FQDN and specifying a Credential Object that can be used for authentication to the BIG-IP device.

NOTE: An F5 Application Object has already been created and is currently managing the BIG-IP device certificate. A new Application Object will be created to manage the machine identity associated with the ecosystemapp application.

3. Right-click the **bigip1.venafidemo.com** Device Object and then click **Add > Certificates > Server Certificate** and enter the following information:

```
"Certificate Name": "ecosystemapp.venafidemo.com"
"Common Name": "ecosystemapp.venafidemo.com"
"Organization": "Venafi"
"Organization Unit": "Ecosystem"
"City": "Salt Lake City"
"State/Province": "UT"
"Country": "US"
```

* Certificate Name:	ecosystemapp.venafidemo.com
Description:	
Contact(s):	local:tppadmin (\\VED\\Identity\\tppadmin)
Approver(s):	local:tppadmin (\\VED\\Identity\\tppadmin)

 Processing Disabled: ☐

10. Verify the certificate is in use by the virtual server by navigating to the Virtual Server IP address at <https://192.168.2.10> or <https://ecosystemapp.venafidemo.com> and using the browser to inspect the certificate. The issue date should be today's date.

Section 2: Transitioning from BIG-IP to BIG-IQ

The steps in this section will bring the BIG-IP server under the management of BIG-IQ. All future lifecycle operations involving the machine identity will be initiated from BIG-IQ. The BIG-IQ virtual machine sometimes has issues when resuming from a suspended state.

If the VM wasn't reset in the previous section, or if the environment has suspended and resumed since then, the following steps will ensure all devices and services are working as expected.

1. Click **View VM** on *BIG-IQ*.
2. Click inside the black window and press **Enter** on the keyboard to wake up the CLI.
3. Restart BIG-IQ by typing the following command and waiting for services to come back (about 5 minutes):

```
reboot now
```

NOTE: You should see the BIG-IQ Login Screen when the device has finished starting up:

Configure BIG-IQ

1. Navigate to the "BIG-IQ" bookmark and login with the following credentials:

```
UN: admin
PW: VenP@ss123!
```

2. Click on the **Devices** tab and then click **Add Device** and enter the following information, then click **Add**.

```
"IP Address": 192.168.1.201
"Port": 443
"User Name": "admin"
"Password": "VenP@ss"
```

The screenshot shows the F5 BIG-IP web interface with the 'Add Device' configuration page. The left sidebar contains a navigation menu with options like 'BIG-IP DEVICES', 'BIG-IP DEVICE SILOS', 'BIG-IP ONBOARDING', 'BIG-IP VE CREATION', 'BIG-IP CLUSTERS', 'DEVICE GROUPS', 'BACK UP & RESTORE', 'IP POOLS', 'DEVICE TEMPLATES', 'GEO-IP DATABASE MANAGEMENT', 'CONFIG TEMPLATES', 'SCRIPT MANAGEMENT', 'LICENSE MANAGEMENT', 'PASSWORD MANAGEMENT', and 'SOFTWARE MANAGEMENT'. The main content area is titled 'Add Device' and includes sections for 'Options', 'General Properties', 'Cluster Properties', and 'Silo Properties'.

Options

Discovery Type

- ☒ Add a single BIG-IP device and discover and import services.
- ☐ Add BIG-IP device(s) and automatically discover and import services.

General Properties

IP Address: 192.168.1.201

Port: 443

User Name: admin

Password: VenP@ss

Cluster Properties

Cluster Display Name: None

Silo Properties

Target Silo

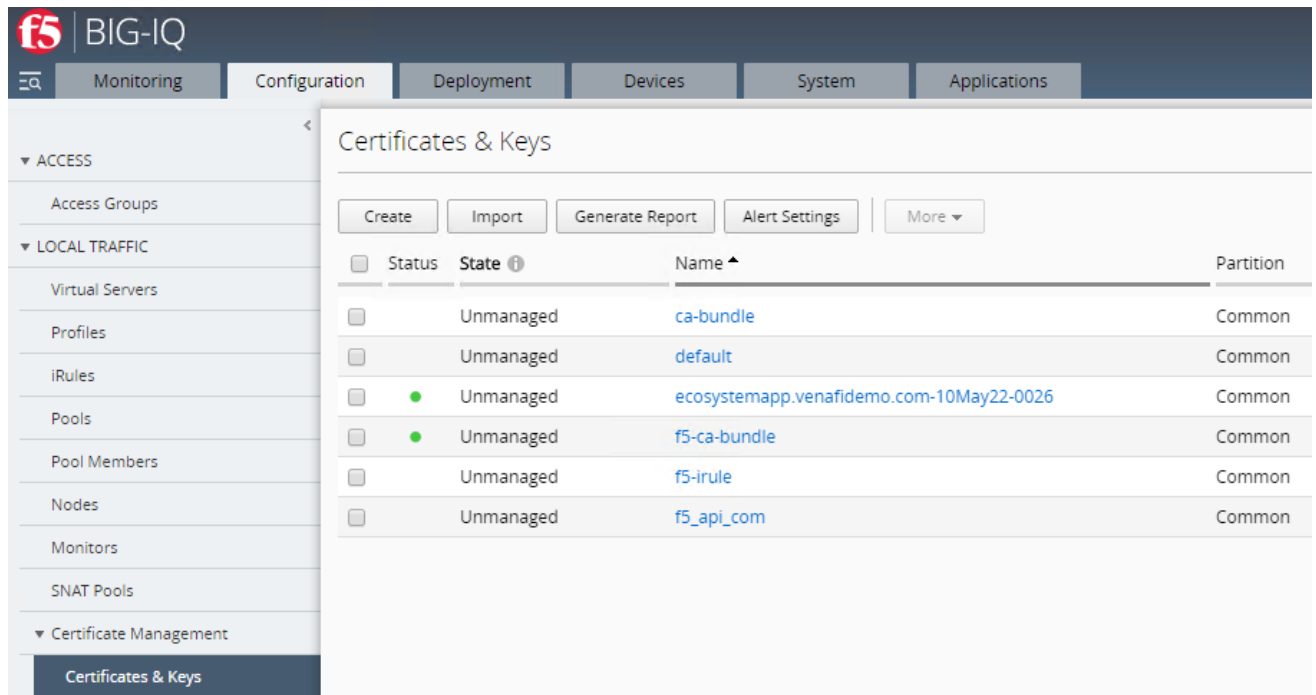

- ☒ Do Not Use a Silo
- ☐ Use an Existing Silo
- ☐ Create a New Silo

- Leave the default "Local Traffic (LTM)" selected and click Continue. When complete, bigip1.venafidemo.com should be listed in the device list.

The screenshot shows the F5 BIG-IP web interface with the 'BIG-IP Devices' table. The table has columns for Status, Device Name, IP Address, and Cluster Display Name. A single device is listed with the name 'bigip1.venafidemo.com' and IP address '192.168.1.201'.

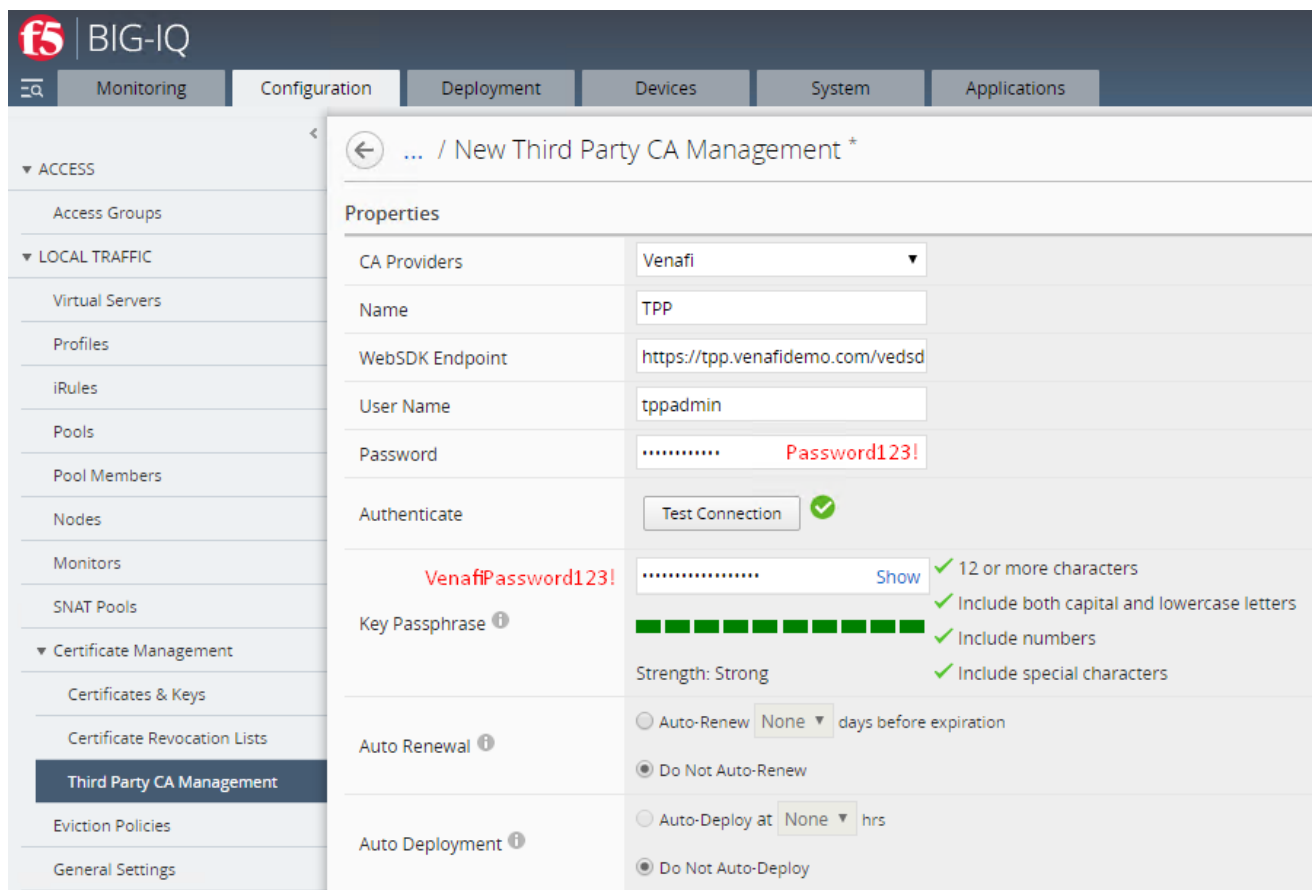

Status	Device Name	IP Address	Cluster Display Name
<input checked="" type="checkbox"/>	bigip1.venafidemo.com	192.168.1.201	

- Click on **Complete Import** Tasks in the "Services" column and then the **Import** button to import the current configuration of the BIG-IP device added in the previous step.
- Click the **Configuration** tab, then **Local Traffic** > **Certificate Management** > **Certificates & Keys**. The certificate created in Section 1, "ecosystemapp.venafidemo.com" is present and listed as "Unmanaged."

6. Next, click **Third Party CA Management**, then **Create** to configure TPP as a CA provider using the following values, and then click **Test Connection** to validate.

```
"CA Providers": "Venafi"  
"Name": "TPP"  
"WebSDK Endpoint": "https://tpp.venafidemo.com/vedsdk"  
"User Name": "tppadmin"  
"Password": "Password123!"  
"Key Phrase": "VenafiPassword123!"
```

NOTE: In order for the above step to complete successfully in production environments, the Venafi Operational Certificate must be publicly trusted, OR the root certificate of the internal CA must be added to the Java trust store on BIG-IQ.

7. Before continuing with the BIG-IQ configuration, users will want to configure TPP with a logical BIG-IQ policy folder structure. Navigate back to Web Admin and create the following two new Policy folders under the existing BIG-IQ folder. These newly created folders will be used in steps later in the lab. For this example, the **Ecosystem App** folder will be used for our existing application. The **Internal App** folder will be used to demonstrate additional policy options that can be enforced by Venafi Trust Protection Platform.
8. Right-click the **BIG-IQ** folder, select **Add > Policy**, name it **"Ecosystem App,"** and configure the policy with the following settings, ensuring to lock the policy values. Be sure to click **Save** at the bottom of the page to save the configuration settings.

```
"Organization": "Venafi"
"Organization Unit": "Ecosystem"
"City": "Salt Lake City"
"State/Province": "UT"
"Country": "US"
```

10. Since BIG-IP will be handling the provisioning process, the Management Type of the BIG-IQ parent folder needs to be set to Enrollment, and child folders should be set to inherit this policy value.
11. Next, navigate back to the BIG-IQ interface and complete the configuration of the Third-Party CA Management Provider, TPP, created earlier. From the Third-Party CA Management page, click **Edit Policy**.
12. Enter `\VED\Policy\Certificates\F5\BIG-IQ\` to specify the top-level folder that should be connected to BIG-IQ and then click **Get**. The **Device Folder Path** can be left with the default value.

Internal App	<input type="text" value="Internal App"/>	\VED\Policy\Certificates\F5\BIG-IQ\Internal App

NOTE: The two policy folders created earlier should populate under the Policy Folder List

13. Click **Save & Close** at the bottom of the page.

Migrate Application

This use case outlines the steps necessary to introduce BIG-IQ to an existing environment that includes Venafi and BIG-IP. Because BIG-IQ is going to be handling the provisioning process from this point forward, the easiest thing to do is use BIG-IQ to issue a new machine identity for the application, directly from BIG-IQ. Exactly when will depend on your particular use case - the transition can take place anytime before the original certificate expires.

1. Navigate to **Configuration > Local Traffic > Certificates & Keys** and click **Create** and fill in the details for the new certificate:

```

"Name": "ecosystemapp.venafidemo.com"
"Issuer": "TPP"
"Policy Folder": "Ecosystem App"
"Common Name": "ecosystemapp.venafidemo.com"
"Password": "VenafiPassword123!"
"Confirm Password": "VenafiPassword123!"

```

- Finally, the changes must be pushed down to the BIG-IP device – this is done using a “Deployment” from the BIG-IQ interface. Navigate to **Configuration > Local Traffic > Virtual Servers**
- Select the “vs_ecosystem” Virtual Server and click **Deploy**
- Give the deployment job a descriptive name, like “ecosystemapp-deployment”
- Scroll down and ensure “vs_ecosystem” is selected as the Source Object:
- Next, click **Find Relevant Devices**, in the bottom-left corner, to search for any BIG-IP devices that this can be deployed to – bigip1.venafidemo.com should be the only device listed. Select it and then click the arrow to move it into the “Selected” column. The final configuration should look like this:

... / New Deployment - Local Traffic & Network *

Name:

Description:

Create Cancel

- When the target device has been selected, the Create button will become available. Click **Create** to create an "Evaluation." Once the evaluation has been created, users are able to click View in the "Differences" column to see exactly what will change when the new deployment is pushed down to the BIG-IP device.
- Finally, scroll to the bottom and click **Deploy Now**.
- Navigate back to <https://ecocsystemapp.venafidemo.com> and inspect the certificate. The virtual server should now be using the latest certificate that was requested via BIG-IQ.

Section 3: Deploying a new application using BIG-IQ and Venafi

This use case outlines the steps necessary to request a new certificate from BIG-IQ, and create a new SSL Profile. There are a lot fewer steps in this section because this demonstrates a net new application. There is nothing to migrate. In this example, like the last, BIG-IQ is authoritative over the certificate lifecycle and all provisioning tasks originate from BIG-IQ, rather than Trust Protection Platform.

- From the BIG-IQ management interface, click the **Configuration** tab and then navigate to **Local Traffic > Certificate Management > Certificates & Keys**
- Click **Create** and fill in the details for the new certificate. You'll notice that the certificate policy for this folder is a little more relaxed due to the configurations we made in Section 2. You can choose to enter your city & state, or simply leave the fields blank.

✓ Include both capital and lowercase letters
✓ Include numbers
✓ Include special characters

3. Click **Save & Close** to begin the issuance process. The page that follows should show a new “Managed” certificate and values will continue to populate as that certificate goes through the lifecycle. When processing is complete, the status should turn to green:

Certificates & Keys

<div> <div>Create</div> <div>Import</div> <div>Generate Report</div> <div>Alert Settings</div> <div>More</div> </div> <div>Items: 8</div>						
<input type="checkbox"/>	Status	State	Name	Partition	Silo	Contents
<input type="checkbox"/>		Unmanaged	ca-bundle	Common		Certificate Bundle
<input type="checkbox"/>		Unmanaged	default	Common		Certificate & Key
<input type="checkbox"/>		Unmanaged	ecosystemapp.venafidemo.com-02Sep22-00...	Common		RSA Certificate Bundle ...
<input type="checkbox"/>		Managed	ecosystemapp.venafidemo.com	Common		RSA Certificate & Key
<input type="checkbox"/>		Unmanaged	f5-ca-bundle	Common		RSA Certificate
<input type="checkbox"/>		Unmanaged	f5-irule	Common		Certificate
<input checked="" type="checkbox"/>		Managed	internalapp.venafidemo.com	Common		RSA Certificate & Key
<input type="checkbox"/>		Unmanaged	f5_api_com	Common		Key

4. Finally, navigate back to TPP and verify that the certificate object has been created and it is located in the proper folder, and with the correct settings.

- Subject Alt Name (DNS): internalapp.venafidemo.com
- Organization: Venafi
- Country: US

5. At this point, users should be ready to associate the newly created certificate with a new SSL Profile using BIG-IQ.

This concludes the guided lab, but please feel free to continue exploring the environment, requesting certificates and attaching them to SSL Profiles, creating virtual servers, or anything else you may want to try.

If you have any questions or feedback, please reach out to paul.cleary@venafi.com
